AUTHOR SMIRNOV, G.A.
TITLE On the Construction of Spiral Spring Dynamometers.
 (O konstruirovani pruzhinnykh dinametrov krucheniya.-
 Russian)
PERIODICAL Zavodskaya Laboratoriya 1956, Vol 23, Nr 6, pp 762-762
 (U.S.S.R.)
ABSTRACT The author criticizes a work published by V.N. GARBARCHUK
 under the same title in Zavodskaya Laboratoriia 1956, Vol 22,
 Nr 12 and declares that it only misleads constructors. The
 error committed by GARBARCHUK consists in the fact that
 although GARBARCHUK gives a correct formulation of the oscil-
 lation moment of the machine, he forgets the oscillation
 moment of the half-socket of the dynamometer. Calculations
 carried out in this connection show that the use of light
 metals for the production of such half sockets practically
 does not change the eigenfrequency of the system "machine-
 dynamometer-motor", and that therefore constructors should
 make a point of not projecting light metal half sockets (as
 recommended by GARBARCHUK), but to see to a sufficient
 degree of hardness for the measuring system because the intro-
 duction of a measuring spiral of insufficient hardness may

The Role of V. N. Tatishchev in the Development (Cont.)

of supervisors from Moscow. He established the first mining and manufacturing codes in Russia; he did much to purify Russian mining terminology of foreign terms. It was due to his initiative that the plant laboratories began collections of ores and minerals which later developed into local museums; moreover, it was under his direction that the mineralogical collection was set up at the "Cabinet of Curiosities" organized in St. Petersburg in 1719. The maps of the Urals made under Tatishchev's direction and with his personal participation were not outstanding in their accuracy, but they did indicate the ore deposits and mineral sources known at that time. V. N. Tatishchev tried to get the government to send experienced geodesists who knew astronomy to the Ural district. In Tatishchev's published works we find his views on the nature of fossils in general, on the nature of the mammoth bones in particular, on the origin of hard coal from vegetable remains, on the origin of caves, on the curative values of certain mineral waters in the Urals, etc.

TITLE: Aleksey Nikolayevich Ivanov, the Oldest Geologist
of the Urals (Stareyshiy geolog Urala Aleksey
Nikolayevich Ivanov)

PERIODICAL: Tr. Gorno-geol. in-ta. Ural'sk. fil. AN SSSR, 1956,
vol 24, pp 5-9

ABSTRACT: Aleksey Nikolayevich Ivanov, director of the
stratigraphic and paleontologic laboratories of
the Mining Geological Institute at the Ural branch
of the Acad. Sci. USSR, was born in 1869. In his
youth he became acquainted with mining at the
Lun'yevka hard coal fields, where he worked as
a mine surveyor and studied the methods of developing

Card 1/2

Aleksey Nikolayevich Ivanov, the Oldest Geologist of the Urals
(Cont.)

15-1957-1-27

natural resources under the guidance of his father, N. P.
Ivanov. In 1917 he joined the Perm' University as an
assistant in the department of geology. In 1919 he was
assigned by the geological commission to begin the planimetric
geological investigation on the northern slope of the Urals;
here he spent 15 years studying the hard coal deposits and
searching for the new sources of this material. He introduced
much new knowledge into the stratigraphy of hard coal deposits,
and particularly into the coal stratigraphy of the Tournaisian
stage. At the same time he spent many years teaching in the
Sverdlovsk Mining Institute. In the 1930's he played a major
role in the creation of the Ural Geological Museum in
Sverdlovsk and was particularly instrumental in the develop-
ing of its stratigraphic division. Between the 1930's and
the present time he spent much effort on investigating of the
Ordovician deposits at the western slope of the Urals, and
especially on the study of the fossils in these formations.

TITLE: Development of the designs of a series of rotors of reactive centrifuges used in diesel tractor engines

SOURCE: Seminar po ochistke vozdukha, topliva i masla, 1962. Trudy, no. 3. Moscow, NAMI, 1963, 6-17

TOPIC TAGS: reactive centrifuge, diesel engine, oil purification, rotor

ABSTRACT: The object of the work (started in 1962) was to develop a standard design of several rotors of different size to be used in reactive centrifuges for oil purification in diesel tractor engines. Russian mass-production of the reactive centrifuges for diesel-type tractors was the ultimate target of this effort. Such centrifuges effect better oil purification than the finest oil filters. The development program was based on three British-made (Glasier Company) reactive centrifuges: type GF-0, GF-1, and GF-2. These centrifuges were mounted on a branch-line of the main oil circulation system or directly on the central oil circulation line. The

Card 1/2

L 60277-65

ACCESSION NR: AT5019453

tests were conducted under various simulated operational conditions. Aluminum and bronze served as construction materials. For a nominal 5000 rpm the basic dimensions and other characteristic features such as volume of the rotor (in cm^3), dry weight of the rotor (in kg's), permissible rotor unbalance (in gram \cdot cm), etc. were determined for a series of rotors. On the basis of this study optimum rpm's for maximum oil purification were determined for each rotor of the standard series. Finally, for each rotor, the oil throughput (kg/min) was plotted as a function of inlet pressure (kg/ cm^2) and rotor rpm. Two cases were considered: 1. centrifuge installed directly on the central oil circulation line, and 2. on the by-pass line. Orig. art. has: 5 tables and 5 figures.

TITLE: Distribution of traction forces among the wheels of multi-axle driven automobiles during travel on irregularities

SOURCE: IVUZ. Mashinostroyeniye, no. 7, 1965, 118-126

TOPIC TAGS: highway vehicle data, vehicle engineering, traction torque, automobile traction, tire torque

ABSTRACT: The distribution of normal forces (and thus traction forces) in a multi-axle automobile going over a bump is considered by analyzing the simplified model shown in Fig. 1. The equations for angle β and the reaction forces R'_1 are derived as

$$\operatorname{tg} \beta = \frac{n \left[\frac{Q_s}{2} a \pm \frac{P_1}{2} h_s + \frac{P_w}{2} h_w + \frac{P_{sp}}{2} h_{sp} + \Sigma (P_n r_{s1}) \right] - \frac{Q_s}{2} \Sigma l_1}{c_{\text{equ}} [n \Sigma l_1^2 - (\Sigma l_1)^2]}$$

$$R'_1 = \frac{1}{n} \left\{ \frac{Q_s}{2} - (\Sigma l_1 - n l_1) \frac{n \left[\frac{Q_s}{2} a \pm \frac{P_1}{2} h_s + \frac{P_w}{2} h_w + \right]}{n \Sigma l_1^2 - (\Sigma l_1)^2} \right\}$$

UDC: 629.114.4

Card 1/4

L 8188-66

ACC NR: AP5025428

$$R'_i = \frac{1}{n} \left[\frac{c}{c_{\text{equ}}} h - (\Sigma l_i - n l_i) \frac{c_{\text{equ}} h n l_i - c_{\text{equ}} h \Sigma l_i}{n \Sigma l_i^2 - (\Sigma l_i)^2} \right]$$

By assuming the tangential elasticity of all tires as equal and the dynamic tire radius equal to the radius of curvature of the tire, the equation for the driving or braking (minus sign) forces is derived as

$$P_{xi} = \frac{P_x}{2n} - \frac{h c_{\text{equ}}}{n c_t \lambda} \left[1 + (\Sigma l_i - n l_i) \frac{\Sigma l_i - n l_i}{n \Sigma l_i^2 - (\Sigma l_i)^2} \right]$$

(where c_t = tire stiffness; λ = tangential stiffness; $\Sigma P_{ki} = P_{\Sigma/2}$) for the case of a blocked transmission and equal drive stiffness between tires. This equation holds only for wheels which are in contact, and the whole load is redistributed on the remaining wheels when one or more wheels lose contact. An example is presented showing the distribution of driving torques in a four-axle automobile. The sum of the maximum deviations from the average torque is also plotted as a function of number of axles and axle spacing. The heights h_1 of a bump for which an idle torque develops and h_3 for which slipping of a wheel occurs are derived as

$$h_1 = \frac{P_x \lambda c_t}{2 n c_{\text{equ}} h}$$

and

$$h_3 = \frac{\lambda c_t (P_x - \varphi Q_x)}{2 n h (\varphi c_{\text{equ}} c_t \lambda + c_{\text{equ}})}$$

The action of acetylcholine upon the rhythmical contractions of the skeletal muscle. Kh. S. Koshtoyants, G. D. Smirnov, and K. A. Laricheva. *Compt. rend. acad. sci. U.R.S.S.* 33, 225-8 (1946) (in Russian).—Specimens of *Rana temporaria* were injected with 3-4 drops of 1% curare soln. and allowed to lie on snow for several hrs. The sartorius muscles were then isolated and placed in Biederman's soln. (I) and the spontaneous contractions recorded. Addn. of acetylcholine (II) at concns. of $1-3 \times 10^{-6}$ resulted in a slowing of the rhythm 2-3 times or complete stoppage. Addn. of atropine (III) in concns. of $1-3 \times 10^{-6}$ after addn. of II caused the contraction-rate to rise above its former value. Addn. of II, even to a concn. of 1×10^{-6} , after III, had no effect on the rhythm. When eserine at a concn. of 1×10^{-6} was added to the I, the rhythm was not affected, but the amplitude of the contractions increased considerably. Subsequent addn. of II produced a sharp decrease in the amplitude and a slowing of the rhythm.

Title : Role of tissue sulfhydryl groups and acetylcholine secretion in transmission of excitation in the upper cervical sympathetic ganglia of a cat.

Periodical : Fiziol. zhur. 4, 424-430, Jul/Aug 1954

Abstract : Significance of tissue sulfhydryl groups is indicated in the process of synaptic transmission of excitation in mammals. This again confirms the significance of acetylcholine metabolism in transmission of excitation in the sympathetic ganglia. Results of experiments on cats reveal that interruption in acetylcholine secretion usually takes place after cadmium chloride is injected. This in turn blocks transmission of excitation in the upper cervical sympathetic ganglia. Action on preganglionic part of synapse, within which acetylcholine synthesis takes place, is produced mainly by ions of cadmium. Ezerine briefly renews restorative conductivity after it is injected under conditions of cadmium block. Restoration of acetylcholine secretion takes place during excitation after cysteine is injected, resulting in restoration of nerve impulse transmission across synapse. Diagrams. Nine Soviet and three non-Soviet references.

An attempt has been made to explain the origin of the rhythmical variations of
electrical potentials of the cerebral cortex by the hypothesis of spontaneous func-
tion of cerebral cells. It is supposed to be a reflection of the automatical bio-
chemical functions or the metabolism of the nervous tissue. Experimental findings,
on the contrary, show that the activity of ganglion cells in the cortex is dependent
on the arrival of afferent impulses through the specific and unspecific pathways.

1745

The impulse of one ganglion cell is passed through the dendrites to the neighbouring cells, together with which they form a chain of neurons. In the circulation of impulses in such cortical and subcortical chains of neurons may be seen the basis of the production of rhythmical variations of electrical potentials. Bajer - Brno (II, 8*)

AUTHOR: Rusinov, V. S., Corresponding Member, ^{Academy of} ~~Medicine~~ 30-1-17/39

TITLE: International ~~Convention~~ on Electroencephalography
(Mezhdunarodnyy kongress po elektroentsefalografii).

PERIODICAL: Vestnik AN SSSR, 1958, Vol. 20, Nr 1, pp. 94-97 (USSR)

ABSTRACT: This congress took place at Brussels from July 21 to July 28, and is part of the first international congress on neurology, taking place at the same time and which includes congresses on neuropathology, neurosurgery, and a congress of the Society for the struggle against epilepsy and a symposium on neuro-radiology. During the last ten years electroencephalography attracted ever growing attention of research workers. This development is closely connected with the general successes achieved by electronics. The congress was devoted to the most urgent questions of modern electrophysiology, viz. to the ontogenesis of the electric activity of the cerebrum of man and of animals, the electroencephalography of conditioned reflexes, the pathology and clinic of epilepsy etc. The Soviet scientists E. F. Bassin, Ye. S. Boya and M. G. Berkov reported on the electromyographical analysis of the changes of the muscular tension as a method of localizing organic affections in the central nervous system. The report delivered by V. S. Rusinov
